ARCANE LANGUAGE AUDIT — PHASE 4: whole-language audit and consolidated fixes

Files
- Arcane_Language_Audit_Phase_4.docx: 26-item inconsistency and hole register, integrated architecture, phonology and lexicon decisions, grammar rules G-1 to G-6, closure of Phase 3 decisions, hand-flame worked example, test results, ledger entries D-028 to D-041.
- Arcane_Lexicon_v4_draft.csv: the draft lexicon (140 rows) with class, status and notes. Renamed words list their old forms.
- arcane_lexicon_tools.py, phase4_finalize.py: mechanical checks (phonotactics, near-collision heuristic, rename search, root generator, numeral-parse tests). They read and write fixed working-folder paths and import arcane_phase3_checker.py, so treat them as a record of the checks, not a packaged tool.

Status
Decisions were made under the owner's delegation. Nothing has been tested with listeners. The collision measure is a feature-based heuristic, not an acoustic test. 17 of 17 mechanical tests passed; one first-run failure (numeric identifiers) led to the identifier rule.

Next: Phase 5, the vernacular register (about 100 words, pronouns, questions, politeness, a corpus), then listener tests on the seven renames and the unit-pitch rule.
